

ABSTRACT

5 A novel anti-glare safety divider, which reduces headlight glare from
oncoming traffic. The anti-glare safety divider is mountable on highway
and/or local road dividers. It is comprised of a mounting frame and plurality
light shield blades. Two types of anti-glare shields are provided. The first
type consists of a series of vertical blades rigidly installed into a blade frame.
The vertical blades incrementally change angles from 60 degrees to 90
10 degrees dependant upon the direction of traffic. The second type consists of
a series of rotating blades, where each series contains more than two wings.
The rotating blades are attached to the shaft rotatably, which is installed
between the upper and lower part of a frame.
